VERSATILE AND SAFE

Hi! is the range of cashless readers which integrates Bluetooth and IrDA technology and unites convenience with maximum security.

Silver and Platinum versions, designed for traditional use with key, but also with card and tag, are compatible with ZiP and MiZiP systems.

Platinum and Light versions can communicate with smartphones via Bluetooth and therefore they are compatible with Breasy and Hi! Manager apps.

All models in the Hi! range are based on flexible and reliable Mifare technology (13.56 MHz radiofrequency communication), enabling the sharing of a Mifare card or tag across different applications such as vending, access control, catering, parking and photocopiers.

125 KHz technology means they are also compatible with ZiP keys.

INNOVATIVE

The Hi! range is designed to satisfy the specific demands of each location.

Mifare technology features a new security level, which delivers increased protection against hacking.

Hi! readers can be installed on all types of vending machines and are compatible with Executive and MDB payment protocols.

Thanks to Bluetooth capability, payments can be made via smartphones by using to the dedicated app Breasy.

And speaking of smartphones, Bluetooth dual mode technology enables programming and data retrieval, providing an obvious advantage to operators thanks to the new Hi! Manager app.

CUSTOMISABLE

Hi! has a sleek, modern design that's easily integrated into the new generation of machines. The whole range is particularly compact, because the electronic control board has been located into the reader head. Thanks to this innovation Hi! systems can be easily integrated into today's table top machines both for external (Silver & Platinum models) and for internal installation (Light version).

The large silk-printable area enables both the reader heads and new tags to be customised, with a wide palette of colours to choose from a chrome-plated finish.
