

VERSATILE AND SAFE

Hi! is the range of cashless readers which integrates Bluetooth and IrDA technology and unites convenience with maximum security.

Silver, Platinum and Plus versions, designed for traditional use with key, but also with card and tag, are compatible MiZiP systems.

Hi! Plus, Platinum and Light versions can communicate with smartphones via Bluetooth and therefore they are

compatible with Breasy and Hi! IES apps.

All models in the Hi! range are based on flexible and reliable Mifare technology (13.56 MHz radiofrequency communication), enabling the sharing of a Mifare card or tag across different applications such as vending, access control, catering, parking and photocopiers.

INNOVATIVE

The Hi! range is designed to satisfy the specific demands of each location.

Mifare technology features a new security level, which delivers increased protection against hacking.

Hi! readers can be installed on all types of vending machines and are compatible with Executive and MDB payment protocols.

Thanks to Bluetooth capability, payments can be made via smartphones by using to the dedicated app Breasy.

And speaking of smartphones, Bluetooth technology enables programming, data retrieval and cloud storage, providing an obvious advantage to operators thanks to the new Hi! IES services.

CUSTOMISABLE

Hi! has a sleek, modern design that's easily integrated into the new generation of machines. Hi! Platinum, Silver and Light versions are particularly compact, because the electronic control board has been located into the reader head. Thanks to this innovation Hi! systems can be easily integrated into today's table top machines

both for external (Silver & Platinum models) and for internal installation (Light version).

The new Hi! Plus reader offers maximum flexibility, allowing you to connect multiple payment systems thanks to an enhanced multiboard capable of managing simultaneous connections.
